I NSTRUCTIONS FOR THE USER: recommendations for use, description of commands and the correct procedures for cleaning and maintenance of the appliance.

INSTRUCTIONS FOR THE INSTALLER: these are for the qualified technician who must carry out the installation, commissioning and testing of the appliance.

Additional product information is available at www.smeg.it

GB-

1. SAFETY PRECAUTIONS

Keep the instruction handbook in a safe place; it contains important information which must be followed when installing, using and servicing the refrigerator. The manual must be kept so that it can be handed over to any future owners of the appliance.

The manufacturer cannot be held liable if the following notices are not respected:

Read this manual before installing and switching on the household appliance. The manufacturer declines all responsibility in case of incorrect installation and use or failure to comply with the precautions described in this manual.

Do not start up an appliance which appears damaged: if in doubt, consult the supplier.

The appliance must be installed and connected to the power grid in accordance with the instructions in the manual. The electrical connection conditions must be as specified on the identification plate, which is in the bottom left-hand corner of the body of the refrigerator. The electrical safety of the appliance is only guaranteed if the electrical equipment is properly earthed.

Ensure that repairs and maintenance are carried out by authorised technicians from Smeq's technical support service only. Always disconnect the appliance from the power grid in the event of a breakdown, maintenance, when replacing the light bulb or during cleaning. Never use electrical equipment or steam cleaners for defrosting. Never remove frost or ice with sharp items, as this may cause irreparable damage to the walls of the refrigerator.

Attention: do not use mechanical devices or any other artificial means to speed up the thawing process.

Do not use adapters or shunts that could cause overheating or burns.

Do not use old or twisted power cords.

Do not twist or bend power cords.

Do not introduce the plug into the power socket with wet hands.

If the power cord is damaged, it must be replaced by the manufacturer, a technical assistance technician or qualified personnel.

Never attempt to move the refrigerator by pulling on the door or the handle.

Keep alcoholic liquids with a high alcohol content hermetically sealed and always in a vertical position. Do not keep liquids in tins or glass containers in the freezer compartment, especially carbonated drinks. Do not keep products containing gases, flammable propellants or explosive substances in the freezer: danger of explosion!

electrical appliances (e.g. ice cream machines or blenders) may not be used inside the appliance.

To ensure the refrigerator operates correctly, never obstruct or cover the air ducts in any way.

Do not touch (especially with wet hands) or put into your mouth frozen products removed straight from the freezer or cooling surfaces. There is a risk of burns due to the ultra-low temperatures.

Do not consume food with an abnormal appearance or smell.

Never allow children to play with the refrigerator, and use the drawers, shelves or other parts of the appliance only as described in this handbook; never use them for purposes other than those for which they are designed.

This appliance must not be used by people (including children) of reduced physical and mental capacity, or lacking in experience in the use of electrical appliances, unless they are supervised or instructed by adults who are responsible for their safety.

If there is a power cut, open the door(s) as little as possible. Frozen food which has been partially or completely defrosted must not be refrozen.

Attention:

this refrigerator contains a small quantity of isobutane (R600a), a CFC-free gas refrigerant. During the transport, installation, cleaning and repair of the fridge, make sure that you avoid damage to any part of the cooling circuit in order to prevent a gas leak. In the event of damage, avoid the use of naked flames and ventilate the area where the appliance is located.

2. ENVIRONMENTAL CARE

Our refrigerators are packaged using only non-polluting, environmentally-friendly, recyclable materials. Please help by disposing of the packing correctly. Ask your supplier or the relevant organisations in your area for the addresses of collection, recycling and disposal centres.

Your old appliance also needs to be disposed of correctly.

Important: hand over your appliance to the local agency authorised for the collection of electrical appliances no longer in use. Proper disposal will enable valuable materials to be recovered. Refrigeration appliances contain gases that can be harmful to the environment, so you need to ensure that the tubes in the coolant loop are not damaged before the relevant organisation takes the appliance away.

Before scrapping your refrigerator it is important to remove doors and leave the shelves in position, to ensure that children cannot accidentally become trapped inside during play.

The power grid connection cable must also be removed and disposed of separately together with the plug.

THIS APPLIANCE IS IDENTIFIED IN ACCORDANCE WITH EUROPEAN DIRECTIVE 2002/96/EC ON WASTE ELECTRICAL AND ELECTRONIC EQUIPMENT (WEEE).

THIS GUIDELINE IS THE FRAME OF A EUROPEAN-WIDE VALIDITY OF RETURN AND RECYCLING ON WASTE ELECTRICAL AND ELECTRONIC EQUIPMENT.

3. INTENDED USE OF THE REFRIGERATOR

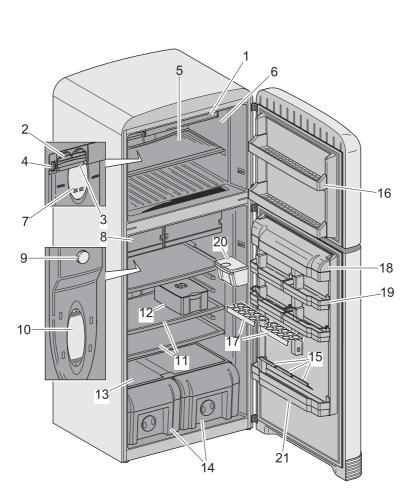

The appliance is specifically constructed for domestic use and is therefore suitable for the refrigeration and storage of fresh and frozen foods and the production of ice-cubes. The appliance is not designed and manufactured for professional use. Smeg cannot be held liable for any damage incurred as a result of incorrect use of the appliance. The refrigerator has undergone the necessary tests on refrigerant circuit tightness.and complies with the safety regulations for electrical appliances.

Attention:

The manufacturer cannot be held liable for any personal injury or property damage caused by failure to observe the above requirements or by tampering with any part of the appliance or using non-original spare parts.

4. PRODUCT DESCRIPTION

- 1 Quick freezing compartment
- 2 Ice cube tray
- 3 Ice container
- 4 Freezer thermostat
- 5 Freezer shelf
- 6 Freezer compartment (ffff)
- 7 Freezer light
- 8 Super-cold shelves
- 9 Refrigerator thermostat
- **10** Refrigerator light
- **11** Refrigerator shelves
- 12 Cheese box
- 13 Drawer cover
- 14 Vegetable crisper
- 15 Anti-tip bottle racks
- 16 Freezer shelf (ff)
- 17 Egg container
- 18 Top shelf with flap
- 19 Egg shelf
- 20 Herb compartment
- 21 Bottle shelf

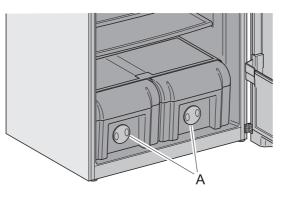

4.1 Shelves

Each refrigerator comes complete with several shelves which can be set at different heights by placing them on the runners provided. In order to remove all the internal accessories, the door needs to be fully open.

4.2 Fruit and vegetable drawer

These containers are at the bottom of the refrigerator compartment, which is fitted with a glass shelf to cover fresh foods that require constant humidity for optimum storage.

When the fruit and vegetable drawer is completely full, the fresh food dial (A) on the front part of the drawer should be open. This way the air and humidity level can be controlled and foods will maintain their freshness longer.

4.3 Door ledges and containers

The inside of the door is fitted with special shelves and boxes to hold eggs, butter, dairy products, tubes, preserves and other similar small items. The bottom of the door has a shelf to hold vertical bottles. To stop bottles from falling when the door is opened and closed, they must be secured with the special retainer rod supplied.

All the door ledges and trays can be removed for cleaning. To remove them from the door, tap them upwards with your fist, first on one side and then on the other in the insertion zone.

4.4 Cheese box

A special cheese box with lid is supplied This box can be placed on any shelf as required.

4.5 Quick freezing compartment

Use the quick freezing compartment to freeze food cooked at home (and fresh food that needs to be frozen) faster, due to the increased cooling capacity of the freezing chamber.

To open the compartment raise the cover and place the item in the compartment. It closes in the same way.

Note:

ensure that the quick freezing compartment cover is closed before closing the door. Otherwise, it loses its quick freezing capacity.

4.6 Super-cold shelves

Storing food in the super-cold compartment instead of the freezer or refrigerator compartments allows the food to maintain its freshness and flavour longer, preserving its appearance. When the super-cold tray becomes dirty, remove and rinse it under water.

Water freezes at 0°C, but food that contains salt or sugar freeze at lower temperatures.

Normally the super-cold compartment is used for fresh fish, food in light brine, rice, etc. ...

Do not place food that you want to freeze here or trays to make ice.

4.7 Interior lighting

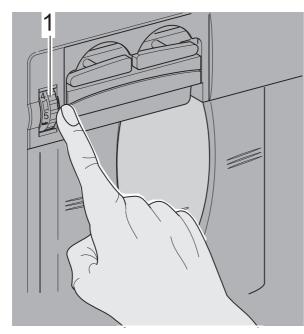

When the refrigerator and/or freezer door is open, the light comes on and stays lit until the door is completely closed. A safety device automatically switches off the light if the door is left open for too long. The same device switches the light on again when it is no longer at risk of overheating.

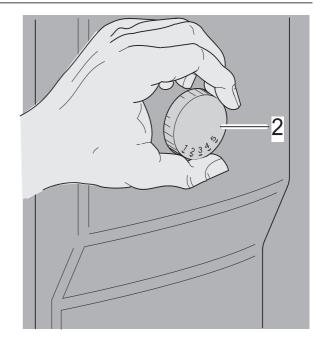

User instructions

5. FUNCTIONS AND FEATURES

5.1 Thermostat settings

1 Freezer thermostat

2 Refrigerator thermostat

The thermostat of the freezer and the refrigerator will automatically adjust the temperature inside the compartments. Lower temperatures can be obtained by turning the knob from position 1 to 5. In cold seasons it is advisable to set higher temperatures to reduce energy consumption.

Freezer thermostat setting;

- 1 2: Place the knob between the minimum and the average position for the short-term storage of food in the freezer.
- **3 4:** Turn the knob to the average position for the long-term storage of food in the freezer.
- 5: For freezing fresh food. The appliance works longer. After reaching the coolest temperature, you must return it to its original position.

Refrigerator thermostat setting;

- 1 2: For a low cold setting.
- 3 4: For a normal cold setting.
- 5: For a high cold setting.

6. USING THE APPLIANCE

6.1 Switching the appliance on

After connecting the device to the power supply, see section "9.3 Electrical connection", adjust the thermostats as described above.

When first turned on, the appliance must operate continuously for 24 hours before cooling to a suitable temperature.

During this period do not open the door too often and do not place large amounts of food inside the appliance.

When the appliance is switched off or unplugged, wait at least 5 minutes before restarting or plugging it in so as not to damage the compressor.

Important

Changes in climatic conditions (temperature and humidity) and the frequency with which fresh food is put into the compartments and the door is opened affect the appliance's operating temperatures.

6.2 Arranging foods inside the refrigerator compartment

Arrange the foods on the various shelves, taking care that they have an airtight wrapping or cover. This precaution ensures that:

- the flavour, moisture and freshness of the foods can be preserved;
- any contamination of foods with odours or tastes from other foods can be avoided.
- the humidity level inside the refrigerator is prevented from becoming too high as a result of the normal transpiration of food (especially fresh fruit and vegetables). In some operating conditions (rise in ambient temperature and humidity, more frequent opening of the door) this might cause condensation to form on the shelves.
- Suitably prepare the meat and cleaned fish that will be consumed within 1-2 days(by enclosing them.in containers or wrapping them in plastic).
- Fruits and vegetables can be inserted into the appropriate compartment without being packed.
- Only use containers suitable for keeping food in. Always allow hot foods and drinks to cool to room temperature before putting them in the compartment.
- To reduce moisture and the consequent increase of frost never put liquids in open containers inside the refrigerator.
- Do not keep explosive substances in the appliance and only keep drinks with a high alcohol content in it if they are properly closed and kept vertical.

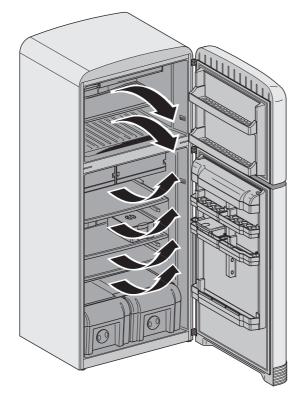

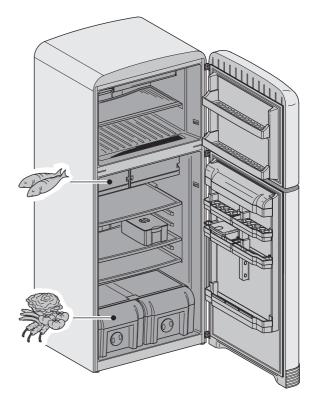

The NO-FROST system with which the appliance is equipped ensures a constant temperature and higher cooling power.

The air which is fan-driven is free of humidity and quickly dries the food placed in the refrigerator compartment. This is another reason to make sure that the food placed in the refrigerator is sealed.

The dry ventilation air chills the food more quickly; the NO FROST system ensures that the temperature is kept more constant

Place the food inside the refrigerator compartment as shown in the diagram

6.2.1 Special meat and fish storage compartment

Some delicate foods such as meat, fish and lightly frozen foods can be stored in the special super-cold drawer, in which the temperature is constantly kept at around 0°C.

6.3 Freezing of foods

The freezer is used for the long-term storage of deep frozen or frozen foods for a long period of time and for the making of ice cubes.

Use the shelf for quick freezing to freeze food prepared at home (and any other food requiring freezing) more quickly thanks to the increased freezing strength of the freezer compartment.

To keep and freeze foods properly, you are advised to pack fruit and vegetables in portions of no more than 1 kg and meat and fish in portions of up to 2 kg. Smaller food packages freeze more quickly which means that the foods' nutritional and taste properties are preserved better, including after defrosting and preparation. Only use suitable freezer bags, tinfoil, cling-film for use with food, and freezer containers. Do not use paper bags, cellophane bags for non-food use and shopping bags or pre-used freezer bags. Package foods in hermetically sealed packages, attempting to ensure that all air is expelled. If using bags, close them with suitable elastic bands or wire ties. Always allow hot foods to cool down to room temperature before putting them in the freezer and ensure that foods which are already frozen do not come into contact with fresh foods for freezing. Always write the date of freezing, the quantity and product on the package, and make sure that foods are fresh and whole.

The max. amount of fresh foods which can be frozen in a 24-hour period is marked on the rating plate. Do not exceed the quantity specified: this can have a negative effect on the efficiency of the freezer and the capacity to preserve the deep-frozen foods which are already in it.

For optimal performance of the appliance so that it reaches the maximum freezing capacity, turn the thermostat knob to the highest position 24 hours before putting fresh food into the freezer. After putting fresh food into the freezer, 24 hours at the maximum position is usually sufficient. After 24 hours, it is not necessary to leave the thermostat of the freezer turned to the maximum position.

Caution; to save energy, when you freeze small amounts of food, it is not necessary to set the thermostat of the freezer to the maximum position.

If the wrapper of the frozen food shows signs of moisture or abnormal swelling, it may not have previously been stored at a proper temperature and the contents may be damaged.

In case of power failure, the freezer compartment maintains its temperature for around 18 hours.

GB-IE

6.4 Keeping deep-frozen foods

When buying deep-frozen foods, always make sure that the packaging is not damaged, the product has not past its expiry date and the thermometer of the freezer in which the food is displayed for sale does not indicate a temperature above -18° C. Also note the manufacturer's instructions regarding temperature, period for which the food can be kept and consumption methods. You are also advised to protect the foods you have bought with suitable insulated containers during transport to avoid defrosting. A temperature increase may reduce the period for which the food can be kept and affect the quality of it. Do not buy deep-frozen products covered in large amounts of frost: they may have already defrosted.

FOOD		STORAGE PERIOD (IN MONTHS)										
	1	2	3	4	5	6	7	8	9	10	11	12
Vegetables								+	+	+		
Fruit										+	+	+
Bread and confectionery			+									
Milk			+									
Ready meals			+									
Meat: beef										+	+	+
veal								+	+	+		
pork				+	+	+						
poultry								+	+	+		
game						+	+	+				
minced meat				+								
Smoked sausage	+											
Fish: oily			+									
non-oily	+											
Chitterlings		+										

To avoid any alterations in the quality of frozen foods, do not exceed the permitted storage period, which varies depending on the type of food.

6.5 Defrosting deep-frozen foods

You are advised to consume partially defrosted foods as soon as possible. Low temperatures preserve the foods but do not destroy the microorganisms which become active after defrosting, potentially leading to a deterioration in the products. If the smell and appearance of defrosted foods appears to be unchanged, they can be cooked and potentially refrozen after they have cooled.

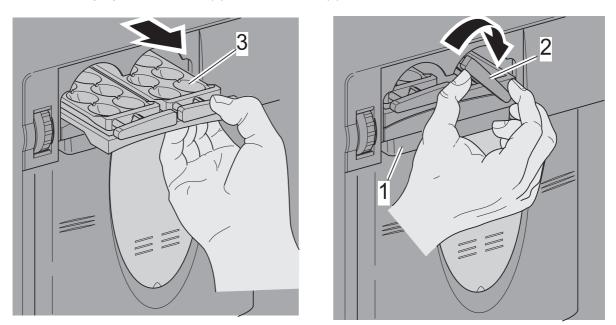

To defrost frozen foods correctly, depending on the type of food and the intended use, they can be defrosted at room temperature, in the fridge, in an electric oven (static or fan-assisted oven function) or in a microwave oven using the appropriate setting.

GB-IE

6.6 Making ice cubes

Fill the tray provided (3) up to the indicated level with cold water or any other liquid that you wish to freeze. Place it inside the freezer compartment in its original position. To remove the ice cubes and drop them into the prepared container (1), rotate the lever (2).

Do not fill the ice container with water (1) in order to produce the ice. It may break.

7. MAINTENANCE AND CLEANING

7.1 Cleaning the refrigerator

Before cleaning, disconnect the plug from the electrical mains. To clean the outside of the freezer, use water and a gentle liquid detergent only, or a detergent for general use on washable surfaces (e.g. a detergent for use on glass). Never use products containing abrasives or substances which may attack the lacquered or painted parts, acids or chemical solvents. Use a sponge or a soft cloth.

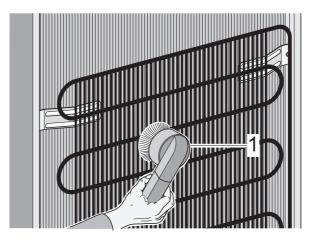

To clean the inside do not use steam cleaners; we recommend the use of specific sanitizing products such as a solution of sodium bicarbonate/soda and warm water. Specific SMEG-brand products for cleaning steel are available from our Service Centres.

Remove the shelves and accessories, taking care not to apply excessive force when removing.

Do not wash removeable plastic parts in the dishwasher, just use lukewarm water and washing up liquid or a water and vinegar solution. Dry all the parts thoroughly after washing and rinsing them. Do not allow the electrical lighting parts to come into contact with water or detergents.

To clean the seals, use lukewarm water and dry them afterwards.

To ensure that the refrigerator functions properly, you will also need to clean the condenser at the back periodically, using a brush or a vacuum cleaner (1).

Upon completion of cleaning, reconnect the power plug with dry hands.

7.2 Switching off the refrigerator

GB-IE

If the refrigerator is to remain out of use for a long time disconnect it from the mains.

Then empty the compartments and dry any residual moisture which has collected. Leave the door ajar to ensure that moisture and stagnant air do not cause unpleasant odours.

7.3 Practical energy saving advice

- Install the refrigerator in a cool, well ventilated place, protected from direct sunlight and well away from heat sources;
- Do not put hot food in the fridge or freezer. Wait for foods and drinks to cool to room temperature before placing them on the shelves;
- Reduce the number of times that the door(s) is/are opened and the length of time they remain open to prevent the units from heating up excessively;
- Clean the condenser (rear of the refrigerator) periodically to prevent the appliance from losing efficiency;
- On models equipped with the rapid freezing function, do not leave this function activated for longer than absolutely necessary;
- If the refrigerator remains unused for a long period, it is advisable to empty the appliance and disconnect it from the mains;
- Thaw frozen foods in the body of the refrigerator in order to take advantage of the cold stored in the frozen foods, which will be transferred to the refrigerator if this procedure is used.

7.4 Noises during operation

The fridge freezer cools by means of a compression system. In order to maintain the preset temperature inside the refrigerator and freezer sections, the compressor comes into operation in response to the level of cooling required, and may operate continuously if necessary. When the compressor starts to function, it creates a buzzing noise which generally diminishes in intensity after a few minutes. Another normal refrigerator operating noise is a gurgling due to the coolant flowing through the pipes in the circuit. This noise is normal and does not indicate an appliance malfunction. If it becomes too loud, this may mean that there are other causes. Checks must then be made to ensure that:

- the refrigerator is properly levelled on the floor and does not vibrate when the compressor is in operation: if this is not the case, adjust the feet it's equipped with;
- The drawers, shelves and trays on the door are correctly positioned in their holders: **if they are not**, **put them in correctly**;
- Bottles and containers on the various shelves are stable and not touching each other: otherwise, the vibration resulting from the compressor's operation could cause a certain amount of noise;
- Do not place the fridge in such a way that it is in contact with furniture or other household appliances.

7.5 Identifying and eliminating any operational faults

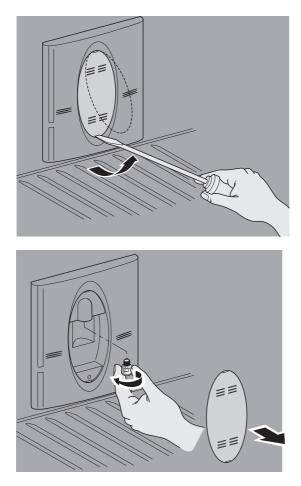

Your new refrigerator is designed and built to strict quality standards. The aim of this section is to enable you to identify the origin of any operational fault that may arise, before contacting Smeg's technical support service.

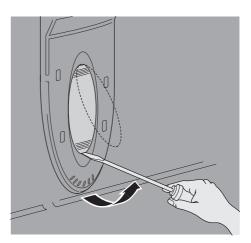

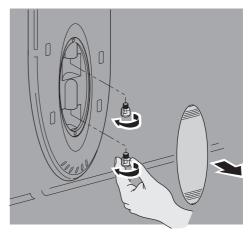

7.6 Replacing the inside light bulbs

BEFORE PERFORMING ANY OPERATIONS, SWITCH OFF THE POWER SUPPLY TO THE APPLIANCE.

Freezer lamps

Refrigerator lamps

Before replacing the bulb, make sure that its failure to operate is not simply because it has become loose inside the lamp holder. In any case, whether you wish to check that the bulb is inserted correctly or you wish to change it, for safety reasons, you must first remove the plug from the power outlet. Use a screwdriver to unscrew the cover and remove it (in the direction shown by the arrow). Replace the lamp with an equivalent one (max. power 25 W).

NOTE In the refrigerator compartment there are 2 bulbs, max. 15 W.

Replace the protective cover of the light and, after waiting 5 minutes, reconnect the plug.

8. TROUBLESHOOTING

PROBLEM	POSSIBLE CAUSE	PROBABLE SOLUTION
Noisy during operation		 see 'noises during operation' section
The compressor starts to function too often or functions continuously:	 insufficient cooling of the compressor and the condenser: 	 check that the back of the freezer is properly ventilated as indicated in section "9.1" and that the condenser is not excessively dirty;
	 increase in surrounding temperature; doors opened often or for long periods; freezer loaded with too many fresh foods 	 freeze less food in one go;
The compressor does not function:	 supply cable not connected to the electricity supply; socket not providing any electricity. 	 contact your electricity supply company
Refrigerator section not cooled sufficiently	 inside temperature setting thermostat set too low (1-2) (provides a higher temperature inside the appliance); frequent or prolonged door opening; the door does not close properly increase in surrounding temperature. 	 open the door less frequently and for as little time as possible; check that the foods are arranged on the shelves correctly and are not preventing the door from closing properly, and that the floor under the refrigerator is level; check that the seal is closing properly and is not damaged.
Door hard to open just after closing:		 if you attempt to open the door again just after closing it (especially the freezer door), considerable strength is required. This is due to the low pressure created by the cooling of the warm air which has entered the freezer.

PROBLEM	POSSIBLE CAUSE	PROBABLE SOLUTION
Temperature inside freezer section	- inside temperature setting	- Turn the regulator to an
not low enough to freeze foods	thermostat set too low;	intermediate setting.
properly:	- frequent or prolonged door	
	opening;	- open the door less frequently and
		for as little time as possible;
	- the door does not close	Ŭ
	hermetically;	on the shelves correctly, that the
		gasket is sealing properly and is
		not damaged, and that the floor
		under the refrigerator is level;

PROBLEM	POSSIBLE CAUSE	PROBABLE SOLUTION
Too much ice forming in freezer	 inside temperature settir thermostat set on too low temperature; 	
The front of the appliance is warm to the touch	-	- the refrigerator is operating normally. There is a surface heating system inside the cabinet to limit the formation of condensation around the door seal.
Doors out of alignment:		- check that the floor under the refrigerator is level, and also adjust the two rear feet if necessary. Check whether changing the settings of the two feet improves the alignment.

CUSTOMER SUPPORT SERVICE – READING THE IDENTIFICATION PLATE.

IF YOU HAVE PROBLEMS WITH THE PRODUCT THAT YOU HAVE PURCHASED WHICH ARE NOT COVERED BY THE TABLE ABOVE AND YOU NEED FURTHER CLARIFICATION, YOU CAN CONTACT OUR AUTHORISED TECHNICAL SUPPORT SERVICE. YOU WILL FIND THE ADDRESS AND TELEPHONE NUMBER IN THE PHONE BOOK FOR YOUR AREA UNDER **SMEG**.

TO SPEED UP THE SERVICE, PLEASE BE READY TO INFORM OUR CALL SERVICE OPERATORS OF THE MODEL OF THE PRODUCT YOU HAVE PURCHASED AND THE SERIAL NUMBER MARKED ON THE NAMEPLATE INSIDE THE BODY OF THE REFRIGERATOR. THANK YOU IN ADVANCE FOR YOUR COOPERATION.

9. INSTALLATION AND CONNECTION

9.1 Choice of location

Always place the refrigerator in a dry place with adequate ventilation. Ensure that it is not directly exposed to the sun's rays and do not place it outdoors. Depending on its climate class (stated on the nameplate inside the refrigerator compartment), the appliance can be used in different temperature conditions:

Class	Room temperature
N (Normal)	from + 16°C to + 32°C
SN (Subnormal)	from + 10°C to + 32°C
ST (Subtropical)	from + 18°C to + 38°C
T (Tropical)	from + 18°C to + 43°C

Never place the refrigerator close to heat sources. If this is unavoidable, in order to prevent the proper operation of the product from being compromised, a suitable insulation board must be used. Otherwise, locate the appliance at least 3 cm away from electrical or gas cookers and at least 30 cm away from combustion heaters or radiators.

To allow proper cooling of the condenser, the refrigerator must not be placed too close to the wall. If the refrigerator is installed underneath a wall cupboard, the distance between the two must be at least 5 cm. Do not place heavy objects on the refrigerator.

If the appliance is installed next to another refrigerator or a freezer, keep a minimum distance of 2 cm between the devices to prevent condensation.

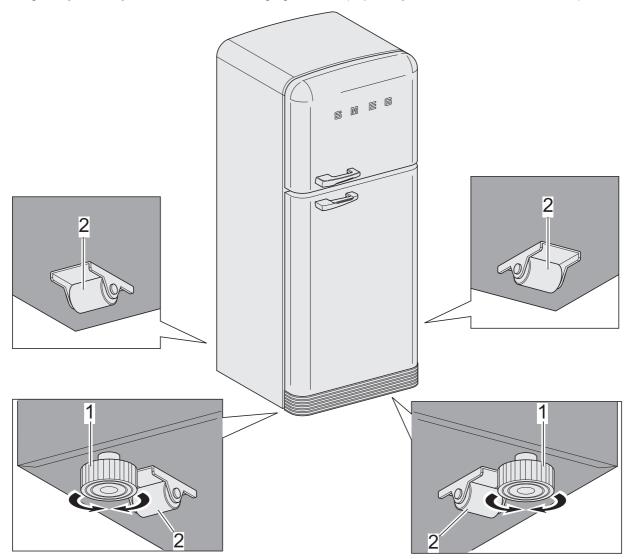

Take care when installing the appliance on parquet or linoleum to avoid scratching or otherwise damaging the floor. If necessary, when positioning slide the refrigerator over pieces of wood or a mat to the point decided on for connection to the electrical mains.

To allow the circulation of air below the appliance, the space underneath must kept empty. Do not close it off with a carpet or anything else.

9.2 Positioning the appliance and making sure it's level

Place the fridge on a stable and level floor. To compensate for uneven flooring and to allow greater stability of the product, the refrigerator has two adjustable front legs (1). To ensure easier movement and correct positioning of the appliance, four wheels are fitted (2). In any case, we recommend moving the fridge very carefully in order to avoid damaging the floor (especially in the case of wooden floors).

The exterior of the appliance and internal accessories should be cleaned with a solution of water and liquid soap; the inside of the appliance with baking soda dissolved in warm water. Replace all the accessories after they have dried.

9.3 Electrical connection

Before switching the refrigerator on for the first time, leave it in a vertical position for at least two hours. Connect the supply cable of the appliance to an earthed electrical socket, installed in accordance with electrical safety standards. The rated voltage and frequency are stated on the nameplate inside the refrigerator compartment. The appliance must be connected to the power grid and earthed in accordance with the applicable standards and requirements. Check that the voltage rating on the nameplate is the same as the mains supply. If the supply cable needs to be changed, this procedure must only be carried out by an **authorised technician from Smeg's technical support service**.

The plug must be accessible when the appliance is installed.

It is possible that you may detect a smell when the appliance is first switched on. This smell will fade when the appliance begins to cool.
